01 / ONE SLIDE — FUTURE FOUNDERS · DATA-CENTRIC AGENTS — COLD → WARM

YOUR LOGS ALREADY KNOW WHAT BROKE. NOW THEY REMEMBER THE FIX.

Log watches your production error stream, spawns an agent per new error fingerprint, and writes the resolution into Postgres. Next time that error fires, the agent starts from memory — **same bug, a fraction of the cost.**

WHO IT'S FOR

SMALL PLATFORM TEAMS CARRYING PRODUCTION ALONE

SRE and platform engineers at seed-to-Series-B startups — 5 to 50 engineers, no observability team, thousands of error lines a day and the same twenty on rotation.

WHY NOW

- **Agents can act.** Read the repo, reproduce, run tests, open a patch — not just summarise.
- **Memory is a managed primitive.** Aiven Kafka + Postgres make per-error recall cheap.
- **Cost per fix collapsed.** Always-on triage now beats one on-call hour.

FIRST USERS

- **Open-source maintainers** already piping CI and runtime logs — free for public repos.
- **10 design partners** from the Aiven and Future Founders networks, onboarded by hand.
- **Show HN + r/SRE** with one recorded before/after run, then an install PR.

EVIDENCE · SAME ERROR, 4 OCCURRENCES

RECORDED RUNS

TOKENS	24.4k COLD · NO MEMO	→	3.9k WARM · MEMO HIT	-84%
TIME	4m 12s COLD · NO MEMO	→	51s WARM · MEMO HIT	-80%

DATA LAYER · WHAT MAKES IT WORK

AIVEN

One agent per fingerprint, one row per run. Stale memories are detected and re-earned, never trusted blindly.
